WPI; 2002-106200/14 P-PSDB; ABP33191 Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation

Claim 1; Page 1338; 2508pp; English.

designated ORF (open reading frame) 1-4534, and sequences ABN75054ABN79587 represent cDNAs encoding them. The invention also encompasses
Delypeptides at least 80% identical to the ORF1-ORF4534 (collectively
referred to as ORFX) proteins, polynucleotides at least 85% identical to
Delypeptides at least 80% identical to the ORF1-ORF4534 (collectively
referred to as ORFX) proteins, polynucleotides at least 85% identical to
Delypeptides, the recombinant production of ORFX proteins, antibodies
competition of the ORFX proteins, antibodies
pecific for ORFX proteins, methods of detecting ORFX polynucleotides and
polypeptides, methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the invention have a wide
range of biological activities, such as cytokine, cell proliferation,
cell differentiation, immune modulation, haematopoiesis regulation,
tissue growth, anglogenesis, activin or inhibin activity, chemotactic/
chemokinetic activity, haemostatic activity, tumour inhibition activity,
and antihinfective activity, and may also be involved in the determination
of bodily characteristics, fertility and behaviour. ORFX proteins,
cof bodily characteristics, fertility and behaviour. ORFX proteins,
cof cher proliferative disorders such as psoriasis and benign tumours,
cof conter proliferative disorders such as psoriasis and benign tumours, cardiovascular diseases, immune system disorders claimed to corgan transplantation, disorders of tissue growth and regeneration, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage disease, and infectious diseases caused by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and clouing of homologous sequences, in genetic diagnosis, be used to produce transgenic animals mucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the neurological disorders such as epilepsy and Alzheimer's disease,

This sequence encodes a H. pylori cytoplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino
                                                                                                                         417
                                                                                                                                                                                                         378 AlaSerThrLysArgLeuLysGlyAspSerArgProValAsnProLeuGluGlnArgMet 397

```
The present invention describes a purified or isolated nucleic acid asquence (I) consisting essentially of one of the 93 nucleotide sequences given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.
homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                           GluAspThrProGlnArgLeuIleAlaGlyIleLeuProAspLeuLeuValLysGlyGly 433

(I) have antibacterial and antiblotic activities, and can be used in gene therapy. Expression of (I) in a microorganism inhibits proliferation of the microcranism, and the manufactured antiblotic is useful for reducing the activity or level of a gene product required for proliferation of a microorganism in a subject, specifically humans. The nucleic acids that inhibit bacterial growth or proliferation can be used as antisense therapeutics for Killing bacteria. In addition to therapeutic applications, the nucleic acid sequences complementary to exequences required for proliferation can be used as diagnostic tools. For example, nucleic acid probes complementary to proliferation-required sequences that are specific for particular species of microorganisms can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rat sequence differentially expressed in response to a hepatotoxin #1264.

Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells

Claim 1; Seq ID No 1264; 239pp; English.

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the compounds or the progression in tissues or cells exposed to the toxic contain and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the hepatotoxicity of a compound, comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or cepsness is indicative of at least one toxic effect or progression of the genes is indicative of at least one toxic effect or progression. Compare genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the coxic response and predict cellular pathways that a compound modulates in a conformation and actions under the specification, a computer of a comprising a set of at least two probes (on a solid support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer of system comprising at least two genes listed in the specification, and a user interface to view the information used to present information identifying the expression level in a tissue or cell of at least one gene classification. The method is useful for elucidating global changes in gene expression and for identifying toxicity markers in the proposed to a known toxin. The genes and the companion and toxicity markers in the proposed to a known toxining the genes and a present information and toxicity markers in the prediction and and proviet the same and and toxicity markers in the proposed to a known toxining the specification. state of tissue or cell tag (EST) or cDNA derived from a gene in response to a hepatotoxic agent. toxicity markers in drug screening and toxicity assays. The genes and gene expression information may be used as diagnostic markers for the prediction or identification of the physiological state of tissue or sample that has been exposed to a compound or agent. Hepatoctoxicity characterised by centrilobular necrosis and steatosis. The present sequence is an expressed sequence which is differentially expressed

```
The present sequence describes a purified corn tassel-derived polynucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70637 to ABL70833. The cdps sequences encode corn tassel-derived polypeptides (CDPs). The cdps sequences (I) can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to clone regulatory elements for use in transformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel purified corn tassel-derived polynucleotide useful for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vectors, to express a polypeptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid hybridisation or amplification technologies, as query sequences to determine homology of known sequences, as probe for use in Southern or Northern hybridisation, and to identify the presence of and/or to determine the degree of similarity between two

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ17779. Also described is method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell
                                                                                                                                                                                           58 ATCGTGAGCTTCGGCGAGATGCTCATTGAC------TTCGTCCCGACCGTGTCGGGG 108
